• APP Grit Guard Bucket dirt separator

The APP Grit Guard is a specialized tool designed in order to limit the amount of scratches which may occur while washing cars. The dirt separator is made out of a synthetic material (PP), which increases the products durability during work in water and while using detergents (the difference is clearly perceivable, especially compared to metal equivalents).

Thanks to the APP Grit Guard, during rinsing a sponge, brush or glove used to for washing cars, the contaminants contained therein fall to the bottom of the bucket, without being transferred back onto the car's bodywork. This limits the possibility of scratching the paintwork, which most often occurs during manually washing the car.

The lower part of the separator features four dividers which prevent the water from swirling and agitating the dirt on the bottom. The upper part, on the other hand, features holes used to freely position the separator in the bucket.

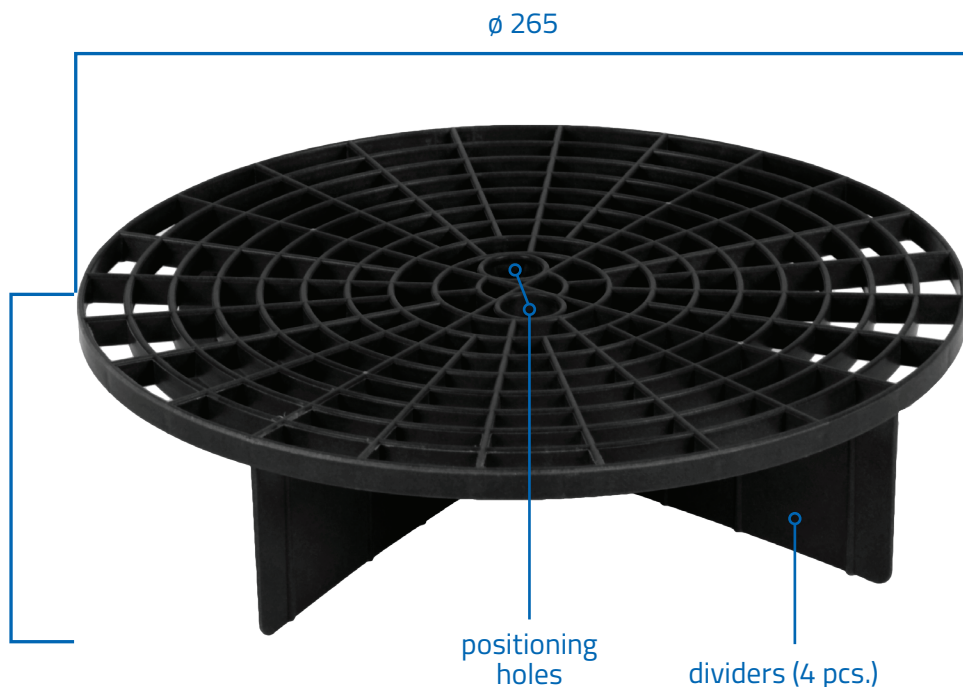

Advantages:

- limiting the possibility of scratching the bodywork (separates dirt from the sponge),
- made out of synthetic materials (PP)
- durable and resistant to detergents,
- facilitates rinsing sponges, gloves, etc.
